

PILIN FRBR Tool

The PILIN FRBR tool is a tool for creating and maintaining identifiers related to each other through the FRBR information model. This information model relates objects which belong to the same intellectual work but differ in content or presentation.

This tool uses the FRBR model of bibliographical entities as its base information model. Although FRBR has broad applicability, its use in this tool is intended only as illustrative: other information models can be supported by persistent identifiers, and persistent identifier management tools can be adapted to operate with different information models.

The PILIN FRBR Tool is included in the [PILIN ANDS Transition Software bundle](#)

The tool includes a custom resolver *//resolver.net.au/frbr-resolve/<handle_id>* which resolves the Handle for an entity to a URL for the *latest* version of the expression, exploiting the relations managed through the tool.

The PILIN FRBR model is built upon JAHDL
